

In Alzheimer's and Down syndrome patients, intracellular and extracellular deposits of proteins in tangles, neurophil threads and neuritic plaques are correlated with neuronal dysfunction leading to dementia (R.D.Terry et al in *Alzheimer Disease*, R.D.Terry, R.Katzman, K.L.Bick, Eds. (Raven, New York, 1994) pp. 179-196). These protein deposits have been shown to contain forms of β amyloid precursor protein (β APP) and ubiquitin-B (Ubi-B) that are aberrant in the carboxyl terminus, and it has further been shown that these aberrant protein sequences are results of frameshift mutations which probably occur at the transcriptional level or by posttranscriptional editing of RNA (F.W. van Leeuwen et al, *Science*, vol 279, pp. 242-247).

In the case of β APP two frameshift mutations have been observed, one by deletion of the di-nucleoside deoxyguanosine-deoxyadenosine (GA) unit from the (ACC)GAGAGAGA(ATG) sequence in exon 9, and one by deletion of a GA unit from the (CAT)GAGAGA(ATG) sequence in exon 10. The mutant β APP peptides resulting from these frameshift mutations are shown in table 1. The peptides with seq id nos 1 and 4 are the mutant part of the β APP protein sequence and the peptides with seq id nos 2, 3 and 5 represent mutant peptides extended into the normal β APP sequence at the amino terminus.

Also in the case of Ubi-B two frameshift mutations have been observed, one by deletion of the di-nucleoside deoxyguanosine-deoxythymidine (GT) unit from the (TCT)GAGAGGT(GGT) ^{seq ID NO: 14} sequence in exon, and one by deletion of a di-nucleoside deoxycytosine-deoxythymidine (CT) unit from the (TCA)CTCT(GGA) ^{seq ID NO: 15} sequence in exon 2. The mutant Ubi-B peptides resulting from these frameshift mutations are shown in table 2. The peptides with seq id nos 6 and 9 are the mutant part of the Ubi-B protein sequence and the peptides with seq id nos 7, 8 and 10 represent mutant peptides extended into the normal Ubi-B sequence at the amino terminus.

Table 2.

The mutant β APP and Ubi-B proteins are only encoded for by cells in which corresponding frameshift mutations have occurred and are therefore targets for specific immunotherapy of Alzheimer's disease and Down syndrome.

According to the present invention, peptides corresponding to mutant β APP and mutant Ubi-B proteins can be used to elicit T cellular immunity and specific killing of cells producing mutant β APP and mutant Ubi-B proteins, which in Alzheimer's disease and Down syndrome patients are correlated with neuronal dysfunction leading to dementia.

of immunostimulatory DNA sequences (ISS). These can take the form of hexameric motifs containing methylated CpG, according to the formula :

5'-purine-purine-CG-pyrimidine-pyrimidine-3'. Our DNA

- 5 vaccines may therefore incorporate these or other ISS, in the DNA encoding the peptides, in the DNA encoding the cytokine or other co-stimulatory molecules, or in both. A review of the advantages of DNA vaccination is provided by Tighe et al (1998, *Immunology Today*, 19(2), 89-97).

10

In one embodiment, the DNA sequence encoding the mutant β APP and mutant Ubi-B peptides comprises:

Normal β APP gene sequence (exons 9 and 10).

15

repeat 1

GAG AGG CTT GAG GCC AAG CAC CGA GAG AGA ATG TCC CAG GTC ATG

repeat 2

AGA GAA TGG GAA GAG GCA GAA CGT CAA GCA AAG AAC TTG CCT AAA (SEQ ID NO: 18)

20

Mutant β APP gene sequence, GA deleted from repeat 1.

GAG AGG CTT GAG GCC AAG CAC CGA GAG AAT GTC CCA GGT CAT GAG

AGA ATG GGA AGA GGC AGA ACG TCA AGC AAA GAA CTT GCC TAA (SEQ ID NO: 19)

Mutant β APP gene sequence, GA deleted from repeat 2.

25

GAG AGG CTT GAG GCC AAG CAC CGA GAG AGA ATG TCC CAG GTC ATG

AGA ATG GGA AGA GGC AGA ACG TCA AGC AAA GAA CTT GCC TAA (SEQ ID NO: 20)

Normal Ubi-B gene (exon) sequence.

deletion motif

ACC CTG ACC GGC AAG ACC ATC ACT GGA GGT GGA GCC CAG TGA (SEQ ID NO: 25)

The invention further encompasses vectors and plasmids comprising a DNA sequence encoding at least one frameshift mutant β APP and/or Ubi-B peptide. The vectors include, but are not limited to *E. Coli* plasmid, a *Listeria* vector and recombinant viral vectors. Recombinant viral vectors include, but are not limited to orthopox virus, canary virus, capripox virus, suipox virus, vaccinia, baculovirus, human adenovirus, SV40, bovine papilloma virus and the like comprising the DNA sequence encoding a mutant β APP and/or Ubi-B peptide.

It is considered that a treatment for Alzheimer's disease and Down syndrome, or prophylaxis for Alzheimer's disease, may be achieved also through the administration of an effective amount of a recombinant virus vector or plasmid comprising at least one insertion site containing a DNA sequence encoding a frameshift mutant peptide to a patient,
